

Transforming rice Husk Into Biodegradable Products(Tablewares)

Tracy Tombila, Samuel Nyorkeh, Sackey Abraham

PROBLEM STATEMENT

Ghana generates 1.1 million tons of plastic waste annually, while 170,000–290,000 tons of rice husk are burned and wasted — creating pollution instead of value.

SOLUTION

Convert rice husk (an agricultural byproduct) into eco-friendly, biodegradable products such as packaging, utensils, and homeware.

TARGET MARKET

- Eco-conscious consumers.
- Restaurants, hotels, and food vendors.
- Supermarkets and retail shops.
- Export markets seeking sustainable packaging and utensils.

COMPETITIVE EDGE

- Rice husk is produced locally in large quantities,
- Ghana is moving toward a ban on single-use plastics
- Few competitors use rice husk

IMPACT

Reduction in plastic waste.
Provides extra income for farmers.
Promotes circular economy (waste → resource). Addresses SDG 12, SDG 13, and SDG 8, while also contributing to SDG 3, SDG 14, and SDG 15.

BUDGET

Expenses Category	Estimated Cost(₵)
Start up cost	105,000
Operational Cost	26,000
Total	131,000
